

3 STEP "CALORIE CALCULATION" TOOL

calculate your BMR by using this equation

BASAL METABOLIC RATE, AKA HOW MANY
CALORIES YOU BURN IN ONE DAY

(Harris-Benedict)	
	MEN BMR = $66.47 + (6.24 \times \text{weight in lbs}) + (12.7 \times \text{height in inches}) - (6.755 \times \text{age})$
	WOMEN BMR = $655.1 + (4.35 \times \text{weight in lbs}) + (4.7 \times \text{height in inches}) - (4.7 \times \text{age})$

how you do that, is take your weight, multiply it by 1.2-1.5 and thats how many grams of protein you need per day! this will be supplying your muscles with enough protein to retain, and decrease any muscle wasting that comes with being in a caloric defecit.

take your BMR and multiply it where appropriate for YOU

If you are sedentary (little or no exercise)

Calories Per Day = BMR x 1.2

If you are lightly active (light exercise or sports 1-3 days/week)

Calories Per Day = BMR x 1.375

If you are moderately active (moderate exercise 3-5 days/week)

Calories Per Day = BMR x 1.55

If you are very active (hard exercise 6-7 days/week)

Calories Per Day = BMR x 1.725

If you are super active (very hard exercise and a physical job)

Calories Per Day = BMR x 1.9

Now, to be in that defecit:take BMR- and subtract 300-500

what number did you come up? this is how many calories you should be eating per day! start with subtracting 300 calories at first for about 2-4 weeks, collect your data and then decrease calories where necessary for fat loss.

calories for building muscle:

for building muscle, instead of decreasing 300-500, you are going to add 300-500 to your BMR.

this will put you in the surplus needed to build efficient muscle.

3 STEP "CALORIE CALCULATION" TOOL

lets talk the boring maintenance phase..

you typically enter a maintenace phase after youve exited your fat loss phase. youre leaner, YAY! however, your body is very eager to get back into its setting point. (settling point is where you put it via nutritononal and environtmental factors). People are not aware of this which is WHY rebound weight gain is so real and happens to the majority of people. so lets talk how to tackle this.

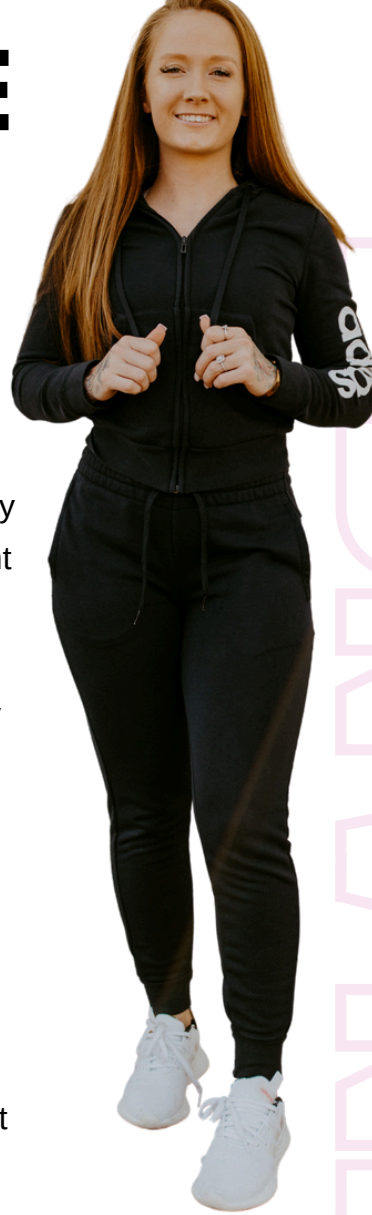

how many calories?

add in 50% of yourdefecit calories. example- if you started at 2500 calories, and ended at 1500, add in 500 calories. that would put you at 2000 calories to start.

- the scale is going to go up a pound or two after your fat loss phase, once that water weight drops, add in 250 calories IF your weight goes DOWN.
- remember, fluctuation is going to be normal
- keep adding 250 calories until you reach your baseline (weight stays the same)

macros for maintenance

same idea as building muscle!

MY FAT LOSS "MACRO METHOD"

protein in take - be the protein queen

When It comes to physique goals, protein consumption is the most important macro to consider.

you actually need more protein when cutting fat, than you do when building muscle!

the reason for that is, because retaining muscle while in a caloric defecit is very contraindicating for your body, UNLESS YOU TELL IT THATS WHAT YOU NEED TO DO!

how you do that, is take your weight, multiply it by 1.2-1.5 and thats how many grams of protein you need per day! this will be supplying your muscles with enough protein to retain, and decrease any muscle wasting that comes with being in a caloric defecit.

So what about carbs and fats?

multiply your bodyweight by 0.3- this is how much fat in grams should be included DAILY- at minimum. all calories left over can be allotted to carbs!

MY BUILDING "MACRO METHOD"

CALORIE INTAKE

So for our fat loss goals, we take our BMR and subtract 300-500. however for building, you want to add 300-500 calories. this puts us in a caloric surplus. in order to build muscle, you need those extra calories. so dont be afraid to EAT!

Protein

take your body weight, and boom. Thats how many grams of protein you want per day.

example: I weigh 133 pounds, so I eat around 135 grams of protein per day.

So what about carbs and fats?

multiply your bodyweight by 0.3- this is how much fat in grams should be included DAILY- at minimum. all calories left over can be allotted to carbs!

what if I dont want to track macros?

go back to the basics and use your hand! make sure youre eating 4-5 meals per day, 2 fist sizes of protein per meal, a palm of carbs per meal, and fat that equals out to your thumb.
